Git Class 2 Assignment -

I hope you guys have completed previous class assignment in which we asked you to locally create a repository named like **<Github_User_Name>.github.io** along with **index.html** file in it. If you have not completed that assignment then please complete it first.

In this assignment you need to perform following task -

- Read hello world github guide (Link in the post).
- Create an empty repository on Github with name **<Github_User_Name>.github.io** . For eg. **Abhey.github.io** will be the name for my github repository.
- Now add this newly created Github repository as remote to your local git repository.
- Push all the changes you made in your local repository to the remote repository.

After you have completed all the above steps, Code for your very first website will be ready. Now open chrome or any other browser you like and type **https://<Github_User_Name>.github.io** .
For example in my case I would type https://Abhey.github.io

Note: You have to use your Github username not your actual name (In my case both of them just happened to be same).

Congrats, you first webpage is ready and is deployed on web. Flaunt your developer skills among your friend.

Now coming on submission part, To mark this assignment as complete you have to attach the link to your newly created webpage. All other submissions will be rejected.

In case of any trouble feel free to contact us.
